Abstract

Purpose: Most of the reasons that result in high staff turnover and cost a lot of money on new employees are rooted in the lack of current job embeddedness and finding a way to keep employees in their current job has always been a concern for Central Bank managers. So the question is how to find a suitable model of human resource management in this regard?

DOI: 10.22054/dcm.2022.67177.1080

Method: Developmental research was designed with a qualitative approach and the strategy of the ground theory. Data were collected from in-depth interviews conducted with 25 expert managers of the Central Bank based on purposeful sampling and continued until reaching theoretical saturation. Using data analysis and coding, the initial conceptual model was created using the opinions of experts. In the quantitative section, 346 lower-ranking employees were selected by stratified random sampling method to answer the questionnaire. Qualitative data analysis was done using the thematic analysis method. Quantitative data analysis by using confirmatory factor analysis was analyzed and coded with the help of SPSS, and AMOS software. Each of them was evaluated separately, based on the systematic method of Strauss and Corbin.

Findings: Eventually, a model was created for organization embeddedness that could be helpful for the organization to reduce costs and increase employee productivity.

Conclusion: Organizations and the community should hire staff only by holding exams and obtaining the necessary quorum for this aim. They should not discriminate against applicants and all should be in the same conditions to qualify and compete so do best to succeed in own job.

Keywords: Organizational Embeddedness, Organizational Structure, Learning Organization, Perceived Organizational Support, Grounded Theory.

1. Introduction

In the human resource management literature, William Tracy defines human resources as "the people who move the organization around in the performance of their duties (Lee et al, 2022). Human resources are one of the most important assets of any organization and

organizations to achieve their goals and implement their strategies must take effective measures in the field of human resource management (Zeraatkar et al, 2020). In today's organizations, the unique role of the human factor as a strategic resource, designer, and implementer of systems is in a much higher position than in the past (Hanelt et al, 2021). Advanced organizational thinking of man as the most important resource and asset for the organization. In the current situation where we are facing a shortage of resources, every organization is trying to increase productivity by establishing new theories to make the most of the minimum facilities (Quinones et al, 2021). Now, we should increase the efficiency of our organization by identifying issues that are out of sight. One of these issues is the organization embeddedness, which little research has been done on it in Iran while it has a great impact on the performance of employees (Garg, 2016). Identifying established employees and taking measures against them can be effective in the employee turnover rate job embeddedness is a way for employees to connect to the workplace and the community in three different forms, such as link, fit, and sacrifice, and stay in their current job. To explain why people, do not change organizations even when it is in their best interest, Michelle proposed a new structure in 2001 called "job embeddedness". Since then, we have defined job embeddedness as the totality of the forces that keep people in their current job, which includes: fit, link, and sacrifice (Marasi et al, 2016).

Factors that increase embedding will vary as they become apparent over time (Erkutlua & Chafraab, 2015). Super's Life-Span and Life-Space theory provide a theoretical basis for explaining the embedding process. The Super's model shows people experience several stages of career advancement such as exploring, growth, establishment, maintenance, and decline during their lifetime. Individual differences and social maps have largely guided progress through these career stages. Super also points out the possibility of different career stages that may occur at different ages for different people, and some people (especially those who change organizations and careers) may go through the work process more than once in their lifetime. Super's Life-Span, Life-Space Theory also claims that the number of roles individuals play and the prominence of these roles

vary between career stages (Ng and Feldman, 2007). Organizational promotion factors may vary in the career process. As people progress in their careers, they are likely to have different roles at work (e.g., bodyguard, mentor, manager, leader, retirees) and outside of work (e.g., child, spouse, community leader). As the patterns and prominences associated with those maps change, so does the set of forces that embed people in their organization and their jobs

In the organization under review, especially the Office of Economic Statistics, which has the largest number of employees, there is a great demand for a job transfer and relocation to the extent that most of the employees working there get out of their job commitment as soon as committing to Central Bank at the beginning of employment. They request for transfer to other departments of the bank. This is not only non-beneficial for the employees, but also creates problems for the relevant organization, which is the Central Bank. New training imposes additional costs on the organization, and it loses its experienced employees in a department and has to replace them with inexperienced young men who will decrease the quality of work. So, the lack of embeddedness in this section is quite obvious. Therefore, the general purpose of this research is to design and test a model for organizational embeddedness in the Central Bank of the Islamic Republic of Iran, and the present study seeks to answer the following question: what are the factors affecting the organizational embeddedness in the Central Bank of the Islamic Republic of Iran?

2. Literature Review

Karl Polanyi introduced the term "embeddedness" as a major development, and he is often regarded as the inventor of the concept of embeddedness (Gemici, 2008). However, many theorists (e.g., Marx, Weber, Schumpeter, and Parsons) tried to use more comprehensive frameworks to introduce embedding in the study of economics and sociology. Granovetter's classic paper is cited as a stimulus for modern research on embedding (Jiménez & Zheng, 2018). He presented as an economic activist in the ongoing patterns of social relations; instead of discussing embeddedness, he continues to

discuss the priority of both individual and social traits, using the overall results of the conflict of the role and personal interest as the only guide to avoiding leaving work. He argues for paying attention to the interaction between social structures and economic activity in industrial societies because all market processes tend to sociological analysis, and these internal analyzes, which are not environmental, reveal the characteristics of these processes. In a thoughtful interpretation of the term itself, Parsons Points out that embeddedness can still be valuable and accurate as a broad effort to expose and correct the shortcomings of the neoclassical traditions of economics.

Moreover, it is considered to eliminate the tendency of economists and others to renew or finalize the market system (Amankwah-Amoah, & Hinson, 2019). These definitions formed in contrast to the specific market concepts exist in neoclassical economics. Embeddedness can also indicate the continuous exchange of economic activities in social structures. Two dimensions of digital embeddedness considered by this study are digital aptitude and digital attitude.

To operationalize digital aptitude, we draw from prior studies that measure skills in using digital technologies (Graham et al., 2019). Drawing on an entrenched view of interconnectedness and rich empirical evidence of a longitudinal study of mixed methods in a recycling company, our paper concludes three Integration processes in digital infrastructure: parallel, competitive and expansive. The enactment of these processes contributes to the emergence of digital infrastructure (Furstenau et al., 2019). This is called the Dynamic Model of Integration in Digital Infrastructures. The model describes how the three processes, when taken together, provide a theoretical explanation of how different forms of digital infrastructures emerge. With this understanding, we propose that the underlying integration process of a digital infrastructure can determine whether the infrastructure will be siloed, regenerated, or unified (Caride, 2016).

Studies on the research topic and its background are given in Table 1.

3. Methodology

This research is applied in terms of purpose, descriptive research, and exploratory approach in terms of research strategy. The data collection was collected by both the library method and field research (using semi-structured interviews and questionnaires). This research approach is a combination of qualitative and quantitative methods (i.e. mixed method, grounded theory) in which appropriate qualitative methods have been used to extract components and research metrics and quantitative methods are used to confirm measurement patterns and test the conceptual model. The statistical population of the study is in the qualitative part was the heads of the central bank departments, and in the quantitative part were several aware employees in the lower levels of the central bank.

3.1. Qualitative method

The qualitative population includes 25 experts of the Central Bank of Iran that participated in the interview. Sampling was done by a judgmental approach, until reaching information saturation. First, the required information was collected to identify the factors affecting organizational maturity by the semi-structured interview method the researcher created the initial mental framework and by coding the first 7 interviews. Then he conducted subsequent interviews and used the new codes to develop the mental framework. The last 2 interviews provided theoretical adequacy. Then, systematic information was formed by grounded theory method of analyzing qualitative data, which includes three main stages of open coding, axial coding and selective coding. This initial knowledge made it possible to formulate hypotheses and how the variables of the organizational embeddedness model work. In other words, qualitative methodology allows the researcher to provide theoretical foundations of the general features of a subject that are simultaneously rooted in empirical data. In this method, in-depth interviews are conducted with a qualitative approach have a different meaning and validity. Because a qualitative interview

is necessarily an interaction through dialogue that is dependent on the temporary situation, and the nature of the relationship cannot be exactly re-created by others. Participants in the study were the managers of departments and deputies of central bank departments, whose information are shown in Table 2

Table 2: Participants in the research (qualitative method of 25 people)

12	Female	PhD	21	Director	25	Female	Bachelor	21	Director
13	Female	PhD	19	Director					

3.2. Quantitative method

A questionnaire was designed to test the model. The sample size was 346 people according to Cochran's formula. In this study, a stratified random sampling method was used according to the recruitment of Central Bank. Due to the dispersion of central bank staff throughout the country, staff in Tehran has been considered as the main cluster. Using quantitative research methods, i.e. path analysis, the researcher tested the data and assessed the validity of the conceptual model of the research. The reliability of the questionnaire was obtained from Cronbach's alpha, which was greater than 0.7. To determine the validity the content validity method was used. To be more specific, the designed questionnaire was validated based on

several experts' opinions. Therefore, the questionnaire has strong validity and is confirmed.

The characteristics of the participants and their demographic information in the quantitative stage has shown in Table 3.

Table 3: Demographics information of respondents

Gender	Number	Age		Education Degree			Work experience		position in Organizational		
		Up to 30	Above 30	B.A	M.A	P.H.D	10 to 20	Above 20	Deputy	Director	Other

Findings

4.1. Qualitative part

As mentioned earlier, to analyze the qualitative data of this research, the content analysis method has been used, which includes the six-step process of Clarke and Braun's (2006) content analysis. Meanwhile, many themes were obtained by open coding. And during the round-trip process, the analysis of the initial qualitative data of all categories was confirmed. Theoretical sampling continued through interviews until theoretical saturation was reached. Based on the analysis of qualitative data and the completion of coding steps, the concepts and categories of embedding that were effective in promoting embedding have been identified, which are shown in Table 4.

Table 4: Coding, Concepts and Categories

Model	Dimensions	Category (optional coding)	Concepts (axial coding)	Open coding

Model	Dimensions	Category (optional coding)	Concepts (axial coding)	Open coding		
Casual Condition	Individual	Work bias Financial needs Occupational prestige Spiritual and psychological strengthening	Fanatic-automatic Good financial situation - no need Occupational prestige – a good reputation Good mood - job motivation	Automated tasks (M12) - No need for inspection (M5) - No financial need (M9) - Meeting the need for the current job (M13) - Job pride (M10) - Appropriate treatment of the client (M9) - Morale (M8) - Appropriate attitude of the boss (M5) - The attitude of colleagues (M12) - Good public image (M6) - Satisfaction of needs (M9) - Feeling of belonging to the job (M4) - Feeling of commitment to the job (M4)		
		Group	Sense of friendship and connection Increase cheerful people Raise honesty Raise a sense of sacrifice	Friendship with colleagues - interaction Cheerfulness - healthy competition Being honest - working flawlessly Preference of colleagues	Strong friendships (M14) - Business relationships (M9) - Jokes with co-workers (M8) - Sense of competition (M12) - Motivation to be superior (M10) - Variety of services (M9) - Being honest (M6) - Not to go out of business (M4) - Performing the duties of colleagues (M8) - Friendship of manager and colleagues (M6) - Preference of friendships over promotion (M5)	
			Organization	Feel the superiority of the organization Encourage managers Being law-abiding No discrimination	Successful organization - welfare superiority Kardan manager - popular manager Regular organization - fixed rules Same view - proportionate rights	Prominent organization (M10) - Effective organization (M19) - Money-making organization (M14) - Conscientious organization (M14) - Motivated manager (M5) - Well-mannered manager (M4) - Conscientious manager (M9) - Law enforcement (M8)) - Specific Duties (M9) - Equality (M6) - Low change (M9) - Adequate payments (M7) - Equality among employees (M7) - Wealthy organization (M6) - Superiority of criteria over relationships (M4)

Figure 1: The final model

4.2. Quantitative part

There are several methods to check the sample size adequacy, including Kaiser-Mir-Oaklin (KMO), the value of which always fluctuates between 0 and 1. If the KMO value is less than 0.5, the data will not be suitable for factor analysis. If the value is between 0.5 to 0.69, factor analysis can be done with more caution, and if the value is greater than 0.7 the correlations between the data will be suitable for analysis. On the other hand, we used the Bartlett's test to ensure the appropriateness of the data. The correlation matrices that underlie the analysis are not equal to zero in the population. In other words, using Bartlett's test, sampling adequacy can be retested. The Bartlett's test examined the hypothesis that the observed correlation matrix belongs to a society with indistinguishable variables. For a factor model to be useful and meaningful, variables need to be correlated.

The Kaiser-Mir-Oaklin value was 0.736, which is greater than the recommended value (i.e. 0.7), and as a result Bartlett's test was statistically significant, which confirms the reactivity of the correlation matrix. The results of this test can be seen in Table 5.

Table 5: KMO test and Bartlett sphericity test

Tests and related indicators	level

Confirmatory factor analysis of research variables

After ensuring the adequacy of research data, to perform factor analysis it is necessary to ensure the accuracy of the model variables. Based on this, the heuristic of factor analysis and confirmatory factor analysis, each of them separately examined the accuracy of the hypothetical conceptual model, which was done by using SPSS and Amos software. Finally, the test were compared presented separately in Table 6.

According to the results, the variables that were confirmed with a high percentage are shown in Figure 1.

5. Conclusion

This study aims to provide a model for central bank embeddedness, which is based on the use of the paradigm model of Strauss and Corbin. From a practical point of view, the present study can be useful for managers to manage employees and embed them and can increase human capital productivity with optimal management. In the proposed model of this research, causal conditions refer to the factors that require the embeddedness of the human resource management process and the existence of these conditions is the factor that creates the need to design such a model for the embedding of employees. Underlying conditions indicate the internal and external conditions of the organization to embed employees in their current job. Conditions must be considered to succeed in the embedding process in the current job. These conditions can improve the

embeddedness and in fact, have a positive effect. On the other hand, the intervening conditions harm the embedding process and can disrupt the implementation of embeddedness. So they can also be called annoying conditions. In this process, the main factor in creating the embedding model is considered as a central phenomenon. Although it cannot be considered the most important factor in embeddedness, if it is ignored, the human resource management process in locating employees will face difficulties. The strategic factor of the model makes it easier to reach well-embedded employees and creates value for the organization and employees. Therefore, the consequences provide the expected results of the implementation of the embeddedness model in the organization. Consequences improve the status of human capital and management of this valuable capital in the organization, increase labor productivity and reduce problems related to staff turnover that can play an important role in the success of the organization.

Considering the role of human resources in improving productivity and transferring experiences to the next generation, and as a result, increasing accuracy and skill, it is necessary to encourage experienced and low-experienced employees based on pre-determined and agreed-upon indicators. In this way, inexperienced employees have enough motivation to stay in their current job by being encouraged by experienced employees.

In the case of hiring staff, indicators should be considered that are fully in line with the job in terms of morale and innate abilities. To assure them that if they get an acceptable rank every year, they will be hired permanently. Adequate salaries, benefits, and welfare facilities are provided to them in comparison with other sections of society.

In working groups, try to create constructive interaction between employees and less sense of boss and subordination, and instead, create mutual understanding between employees and managers, as well as the destruction of colleagues in general, obsolete and strengthen working relationships. It increases the motivation of

teamwork and creates embeddedness between employees, both organizationally and professionally.

Necessary training relating to the job and ways to succeed in the current job should be taught to employees to be theoretically ready to progress in the current job. Managers should be chosen from talented and qualified people so that mutual understanding between them and employees can be obtained. And worthy employees should be praised to create an incentive for staff embeddedness.

Considering that when the value of work is not felt and understood by the people of the society and the employees do not see the reflection of their work, over time, that job will become worthless in the eyes of the employee. Therefore, every year, periodic reports of the organization's performance should be reflected in the mass media so that employees can see the results of their work and efforts. By dealing appropriately with relevant customers, the organization's position among the people is determined and consequently, appropriate social capital is created for employees. Therefore, employees feel the value of their work and embeddedness is established among employees

Governments can make the outside environment a calm and stress-free one by preventing economic pressure on society and maintaining peace between political parties to protect their employees and create embeddedness between them, they can hold sports competitions and cause environmental happiness. So employees can come to work with increased peace of mind and vitality and create embeddedness.

Organizations and the community should hire staff only by holding exams and obtaining the necessary quorum for this aim. They should not discriminate against applicants and all should be in the same conditions to qualify and compete so do your best to succeed in your job. Finally, this research showed that there are ambiguous points in the process of embeddedness that perhaps due to the newness of this issue less attention has been given by researchers so far.
